Definition of food waste

food waste hierarchy

Based on SDG #12.3: Reduce food waste
with 50% by 2030

Food Waste Hierarchy (Moerman)

Braungart & McDonough vs. Gunter Pauli

2002

2012

17 SDG's of the UN

Sustainable Development Goals

- **SDG 1:** With food waste, we can feed all third-world countries.
- **SDG 13:** Combat climate change by reducing greenhouse gases by 1/3.
- **SDG 6:** 1500 liters of water are needed for 100 grams of meat. 85% of the water footprint = agriculture, 5% is used by people, 10% in industry (paper, furniture, etc.).
- **SDG 7:** 30% of energy is used in food systems.
- **SDG 15:** 80% of agricultural land is used for meat, dairy, and eggs. However, this is only a small part of our food (WWF).

Food waste

Worldwide problem

With a circular economy, we can fulfil people's needs with just 70% of the materials we currently use—within the safe limits of the planet.
[The Circularity Gap Report 2023]

Why is the next movie being shown?

Reasons why we need to work together | Understanding the world

Solutions Working together

Everyone in the food system should participate directly to make a **positive impact**

Drawdown, (2021).

Some solutions in the food production chain

Our focus manufacturer and supplier?

Our focus manufacturer and supplier?

- Conversion to human food
- Food production/manufacturing industry

- More impact (bulk)
- No fine-grained distribution needed compared to consumers
- Cleaner residual streams
- Residual streams with more value
- Easier to scale

Maximaliseer de waarde van jouw reststromen.

Jouw focus ligt op het importeren, exporteren of telen van grondstoffen – niet op het optimaal benutten van reststromen. Begrijpelijk: reststromen leveren zelden direct winst op en brengen vaak juist kosten met zich mee.

Bij IntelligentFood is het verwaarden van reststromen onze kernactiviteit. Met ons uitgebreide netwerk, deskundige begeleiding en persoonlijke en professionele ondersteuning helpen wij je stap voor stap om voedselverspilling te verminderen.

Wij creëren de perfecte oplossing om onvermijdelijke reststromen te verwaarden.

Ga van kostenpost naar inkomstenstroom en impact.

- Reducing of material and energy during the entire lifespan of a product, while increasing output with less input
- Often used to reduce negative impacts (e.g. waste, pollution, waste)
- The strategy lowers the ecological footprint, while doing the same things.
- Doing the same, but better!**

Product as a service

- Also referred to as Product as a Service (PAAS models)
- Marketing of a function, instead of selling the product itself
- This strategy can lead to dematerialization, in other words lower the need of new products

Forms of servitisation

1. Product oriented strategy
 - Selling a product with a maintenance package (all types of accessories that fit a specific (reasonable cheap) product (e.g. printers)
2. User oriented service strategy
 - Using idle capacity
 - Supplier remains the owner, while the customer uses the product for the duration of the contract (lease contracts of cars, etc.)
3. Performance oriented service strategy
 - Supplier sells a particular performance, for which the customer pays (e.g. lumen of Philips)

involved

Strategy

Servitisation
strategy

- Making idle capacity available. For example, on average a car is only used 10% of the time.
- Strategy makes often used of a platform to increase usage optimization
- Examples are the MRI machine that is shared among hospitals, Felyx and BlaBlaCar.
- The ecological value is debatable, the intense usage of products increases wear and tear.
- Social value is obtained by making these products available for those with a smaller wallet.

- Essence is to extend the lifetime of the value of a product and its components.
- At the core is product design for life cycle extension and repair.
- Is seen as the central strategy of coming to a circular economy.

Design phase

Type of
business
model

Parties
involved

Strategy

- Developing a loop with several parties, with the intention to retain the materials at the highest possible level.
- Conversion:
 - Sludge into biogas
- Substitution:
 - Plastic waste used in bicycle paths

Cascading strategy³²

Primeur met fietspad van plastic afval

Zwolle heeft een wereldprimeur met een fietspad gemaakt van gerecycled plastic. Het fietspad dat vorige week in gebruik werd genomen is onderdeel van een project 'Plastic Road', dat zou moeten leiden tot meer duurzame wegen die in het hele land kunnen worden toegepast.

JANNEKE VAN DER HEIDE

Van idee naar fietspad
Het idee voor een plastic fietspad is ontstaan door problemen waar gemeenten, provincies en waterschappen mee kampen, zoals grote hoeveelheden neerslag, een grotere behoefte aan mobiliteit en een overvolle ondergrond te combineren met de plastic afvalproblematiek.

Plastic Road

PlasticRoad
Het fietspad bestaat uit gerecyclede plastic elementen, die door het gebruik van een nieuw soort polymeer dezelfde kwaliteiten bezitten als een gewone weg. Het concept is in 2015 gelanceerd door het Nederlandse wegenbouwbedrijf KWS. Samenwerking met de firma's Wavin en het Franse Total zorgden voor de verdere ontwikkeling van het plastic product.

Platform business models

- Logic of value creation

- Brokering of available idle capacity
- Value creation by facilitating the transaction between those with capacity and those in need of it
- Digitalisation and crypto technology enable the development of this model
- Transactions could be bilateral, or multilateral
- Examples:
 - Excess materialsexchange (<http://excessmaterialsexchange.com>)
 - Oogstkaart (<https://www.oogstkaart.nl>)
 - Peerby, Marketplace (marktplaats), ebay, BlablaCar, Floow2, AirBNB

Community based business models

- Logic of value creation
 - A growing number of people is willing to invest in their own neighborhood, if this results in tangible benefits.
 - This is also referred to as “the commons” defined as a set of shared resource(s) material and non-material, maintained or co-created by a community and governed by the same community’s norms and rules (Restakis, 2017).
 - Based on principles of:
 - Joint investment (time, money, energy, waste, mobility)
 - Sharing of results (e.g. power, food, money)
 - **Multiple value creation**
 - Examples include power, food, mobility
 - Windpower Nijmegen

- Logic of value creation

- Value creation by **closing material loops** in order to reduce resource usage, waste and maximise product lifetimes.
- Most material loops require the involvement of **more stakeholders**
- Because of quality loss of the materials itself, the challenge is to **replace virgin** materials with renewable materials. Other circular activities involve **repair** and **maintenance** in order to extend the **life-time of products**.
- Closing the loop fully, is a challenge.

- Examples:

- Rotterzwam (<https://www.bluecity.nl/organisatie/rotterzwam/>)
- Peelpioneers.nl (<https://peelpioneers.nl>)
- Gunter Pauli (<https://www.theblueeconomy.org/en/>)
